

How to Inspect the Scrubber Clean Water Float Switch

1. Empty the recovery tank. Lift the seat forward, then lift the empty recovery tank back to expose the interior of the solution tank.
2. The float switch is located inside the solution tank towards the back side.
3. A closer look.
4. The float switch in this position will tell the scrubber that there is no water in the solution tank.
5. The float switch in this position will tell the scrubber that water is present in the solution tank.

The float switch is located on the same side as the water fill port. It is possible for the float switch to be damaged during the filling process if a hose is inserted too far inside.
