Modification brush lowering device / Linear drive

In collaboration with our supplier, a solution could be implemented, which is preventing the contact point of the limit switch within the linear drive from burning down.

To avoid a contact burn down, a suppressor diode will be built in to protecting the limit switch from short term overcharging.

The new version of the linear drive can be identified according to the reference number on the label provided by the supplier. The reference number of the first version of the linear drive was 53347. The updated version is showing reference number 65597 (see picture on the right).

Service

The modified linear drive is backwards compatible and can be ordered under the existing number 4124205 (18600-71).

Production

TASKI swingo XP

as of machine number 5425
